Additional information about the blueprint

Vertical axis

The descriptors of disorders have been updated to include the terms used in contemporary coding. For example *gastro-intestinal category* is now *digestive system disorder*.

In exceptional circumstances, presentations have been duplicated. For example the presentation of chest pain appears under both cardiovascular and respiratory disorder.

Horizontal axis

To keep the titles on this axis relatively succinct, there is some additional information below about some of them:

Applying and integrating scientific knowledge to make a diagnosis should include recognising acutely ill patients and ensuring that no serious condition is missed.

Disease factors should include inherited diseases and natural history of disease.

Management plan should include pre-operative, post operative and terminal care and where appropriate complementary therapy.

Decision making supported by evidence should include applying the principles of risk management and involving patients and where appropriate their relatives or carers in decisions about their care.

Good practice in prescribing should include the appropriate use of drugs, route of administration calculation of dose and fluid requirements and production of a safe prescription.

Effective communication skills including listening, questioning, explaining, involving patients in management should include listening and sharing information, recognising that patients are knowledgeable, discussing options with patients and explaining the effects of treatment and procedures.

Awareness and sensitivity of the needs and expectations of patients regardless of their lifestyle, culture, beliefs, ethnicity, gender, sexuality, disability, age or social or economic status and understanding the patients' environment and its effect on their health.

Practising ethically and medico-legally should include understanding and applying the principles of professional practice set out in *Good Medical Practice* and supporting guidance including obtaining informed consent and apply the duties of doctors under law including:

- Certification of sickness
- Death certification
- Dealing with the Coroner/Procurator Fiscal
- Procedures for cremation
- Statutory notifications.

Promoting, monitoring and maintaining health of individuals and groups should include being able to audit and appraise epidemiological data.

Keep accurate medical records should include information literacy.

Performing clinical and procedural skills safely should include:

- Demonstrating competence in basic and advanced life support skills and basic trauma support
- Using local anaesthetics
- Giving intramuscular and subcutaneous injections
- Preparing and administering intravenous medicines
- Measuring and interpreting blood pressure
- Performing and interpreting ECG
- Performing and interpreting peak flow rate
- Performing venous and arterial puncture
- Gaining intravenous access including setting up an ivi
- Complying with infection control
- Disposing of potentially dangerous instruments
- Assessing suicide risk
- Assessment of altered mental state
- Performing a cervical smear
- Dealing with aggression
- Using an ophthalmoscope
- Giving pain relief
- Using a speculum and performing a vaginal examination
- Suturing a wound
- Urine testing
- Using an auriscope.

Patient safety and risk management should include promoting monitoring and maintaining health and safety in the clinical setting and systems of quality assurance including governance, audit, CPD, appraisal, revalidation. Dealing with complaints remains a separate heading under relationships with patients.

Testing method

Many of these will be assessed as part of the PLAB test. Some skills are, however, best assessed in the workplace and will form part of the appraisal process, which will be used as a source of evidence for revalidation. Examples of these follow:

- Taking appropriate action if one's own health, performance or conduct or that of a colleague puts patients, colleagues or the public at risk
- Recognising personal and professional limits and asking for help from senior colleagues and other health and social care professionals when necessary
- Developing a portfolio of evidence that records participation in educational and clinical teaching sessions and allows one to identify learning needs and develop a plan to meet these
- Contributing to audits and understanding how the results of audit can improve one's own practice and that of others
- Responding constructively to the outcome of appraisal and performance review
- Contributing to the appraisal and review of students with whom one works
- Working with colleagues
- Teaching and training
- Probity
- Health
- Completing legal documents.

Blueprint for PLAB Test

Disorder	Presentation	Adult/ Child	Acute/ Chronic	Condition	Good clinical care: diagnosis					Good clinical care: management			Good clinical care: clinical and procedural skills			
					Applying and integrating scientific knowledge to make a diagnosis	History taking including identifying key findings	Clinical examination	Identifying, requesting and interpreting appropriate investigation	Disease factors	Management plan including management of common emergencies and using appropriate treatment in specified conditions	Decision making supported by evidence	Good practice in prescribing	Performing clinical and procedural skills safely	Promoting, monitoring and maintaining health of individuals and groups	Patient safety and risk management	Keeping accurate records
Blood and lymph	Abnormal blood film	Adult/ Child	Acute/ Chronic	Including haematological malignancies and myeloproliferative disorders												
Blood and lymph	Blood loss	Adult/ Child	Acute/ Chronic	Any cause												
Blood and lymph	Bruising/bleeding/purpura	Adult/ Child	Acute/ Chronic	Any cause												
Blood and lymph	Enlarged lymph nodes	Adult/ Child	Acute/ Chronic	Any cause including splenomegaly												
Blood and lymph	Pallor	Adult/ Child	Chronic	Anaemia of any cause												
Cardiovascular	Chest pain	Adult	Acute	Acute myocardial infarction, acute coronary syndrome												
Cardiovascular	Chest pain	Adult	Chronic	Coronary heart disease: angina												
Cardiovascular	Palpitations	Adult	Acute/ Chronic	Arrhythmias and heart conduction defects including AF												
Cardiovascular	Peripheral arterial disease	Adult	Acute/ Chronic	Including aneurysms, ischaemic limb and occlusions												
Cardiovascular	Peripheral oedema, breathlessness	Adult/ Child	Acute/ Chronic	Heart failure including valvular heart disorder												
Cardiovascular	Peripheral venous problems	Adult	Acute	VTE/ DVT including risk factors
